

# Project 11:

## BootStrap Oriented Project

In this Project you are requested to start creating a web page of your choice using bootstrap.

At the time of writing, we have already made an introduction to bootstrap and some main features it supports. During the next courses, we are going to continue with bootstrap (and some backend of course), thus my goal is to create projects linked to one another, in order for you to develop a complete, professional website with the things we have learned until this point.

That being the case, in this project I would like you to think about a website you wish to create (even for a real person/business/organization etc) . Once you have done that, I would like you to think and make a draft of your sites' appearance and the color palette you wish to use.

You may make your own research regarding what is trending now, like for example in the links below:

<https://visme.co/blog/website-color-schemes/>  
<https://hookagency.com/website-color-schemes/>

Once you have done that, you may start developing your Bootstrap Project

In your project you need to include

- containers with spacing and color utilities and responsive containers...
- Grid system: Create columns that display differently on different devices and some of them are centered.
- Add nested columns
- Insert some images within your columns
- Use flexbox css and bootstrap flex
- Try to make content as semantic as possible

Keep in mind that the goal is, as we proceed with the training to enhance this website in the following Projects.

**Good Luck!**
